Why We Exist

Breast cancer is the most common cancer among Nigerian women, yet over 70–80% are diagnosed only when the disease is already advanced. WCPI is bringing digital mammography screening directly to women’s communities through our mobile mammography program

Empowering Women. Advancing Early Detection. Saving Lives.

2023: Beginning of our Mammogram Screening Program

Our mammography screening started with an observational pilot using existing diagnostic centers in Abuja and Lagos. We provided free mammograms to over 900 women at Medicaid Radiodiagnostics (Abuja), and later partnered with Arrive Alive Diagnostics and Evacare Hospital in Lagos.

While these early partnerships taught us valuable lessons, they also revealed key challenges — from unreliable infrastructure to high per-patient costs — highlighting the urgent need for our own self-sustaining system.

OUR JOURNEY OF IMPACT

- **Ethics-approved** study to track early breast abnormalities
- **May 2024:** Launched digital mobile mammogram screening
- **Over 6,000** Women Have Received Free Mammogram Screenings Across Lagos and Abuja
- **In 2025,** we commissioned a dedicated PACS server
- **In 2025,** we installed a solar power system in our office
- **August 2025:** received an appreciation award from the Lagos State Health District I

Who We Are

Women’s Cancer Prevention Initiative (WCPI), is a nonprofit organization transforming women’s cancer care in Nigeria.

Our mission is simple but urgent: to make early detection of breast and cervical cancers accessible to all Nigerian women, regardless of where they live or what they earn.

2024 — Innovation and Expansion

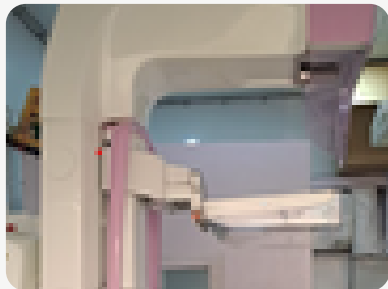

In 2024 we took a bold step — we built our first digital mobile mammography unit. We acquired a PlanMed full-field digital mammography machine from Finland and converted a Hyundai truck into a fully equipped, radiation-safe mobile clinic, designed and fabricated locally in Lagos.

In May 2024, we officially launched the WCPI Digital Mobile Mammography Van. That year alone, our team screened 3,776 women — with 2,836 screened via our mobile unit, reaching communities that had never before had access to mammography.

Our Vision for the Future

Over the next five years, WCPI aims to:

Scale our mobile screening program nationwide, reaching every state in Nigeria.

Collect longitudinal mammogram data to train an AI-based model that predicts breast cancer risk specific to Nigerian women.

Empower local health systems through training, data sharing, and public-private partnerships.

Ensure no Nigerian woman is left behind in the fight against breast cancer.

2025 — Recognition and National Expansion

By 2025, WCPI had become one of the most active community-based breast cancer screening programs in Nigeria, screening an average of 700 women per month.

We expanded our target group from women aged 40–65 years to 40–70 years, ensuring more inclusion and early detection opportunities.

In August 2025, WCPI received the Appreciation Award from the Lagos State Health District I, in honor of our “invaluable contributions, partnership, and positive impacts towards the achievement of the Health District’s vision.”

Join Us in Making a Difference

Every contribution helps us bring life-saving breast screening to more women, especially those who have never had access before. Together, we can change the story of breast cancer in Nigeria.
